

PORT-FORWARDING

Definition:

Port forwarding is a networking process that **redirects traffic** from one IP address and port number combination to another, **allowing external devices to access services** on a private network.

Scenario :

Imagine you're running a **web server** on your laptop inside your home network (Private IP: **192.168.1.100**, Port **80**).

- Normally, people **outside** (on the internet) **can't access** it, because your home network uses **NAT** (Network Address Translation).
- So, you tell your router:
"When someone connects to my **public IP** on **port 8080**, forward that to my **laptop** on **port 80**."

So:

Incoming: 203.0.113.5:8080 → Forwarded to: 192.168.1.100:80

Now anyone visiting **http://203.0.113.5:8080** sees your local web server.

Workflow:

[INTERNET USER]

|

v

Public IP:203.0.113.5:8080

|

| (Router receives incoming packet)

|

[ROUTER: Port Forwarding Rule]

|

|---> Forward to --> [LOCAL SERVER 192.168.1.100:80]

|

|---> Response goes back via router

|

<--- To Internet User

Example:

For example we are running a **apache web server** on our desktop inside your home private network

Private IP: **192.168.91.130**, Port **80**

```
[ranger@localhost ~]$ sudo systemctl status httpd
[sudo] password for ranger:
● httpd.service - The Apache HTTP Server
   Loaded: loaded (/usr/lib/systemd/system/httpd.service; enabled; vendor preset: disabled)
   Active: active (running) since Sun 2025-10-05 12:51:35 EDT; 4min 39s ago
     Docs: man:httpd(8)
           man:apachectl(8)
  Main PID: 1444 (httpd)
    Status: "Total requests: 0; Current requests/sec: 0; Current traffic: 0 B/sec"
   CGroup: /system.slice/httpd.service
           └─1444 /usr/sbin/httpd -DFOREGROUND
             └─2596 /usr/sbin/httpd -DFOREGROUND
               └─2598 /usr/sbin/httpd -DFOREGROUND
                 └─2599 /usr/sbin/httpd -DFOREGROUND
                   └─2601 /usr/sbin/httpd -DFOREGROUND
                     └─2602 /usr/sbin/httpd -DFOREGROUND

[ranger@localhost ~]$
```

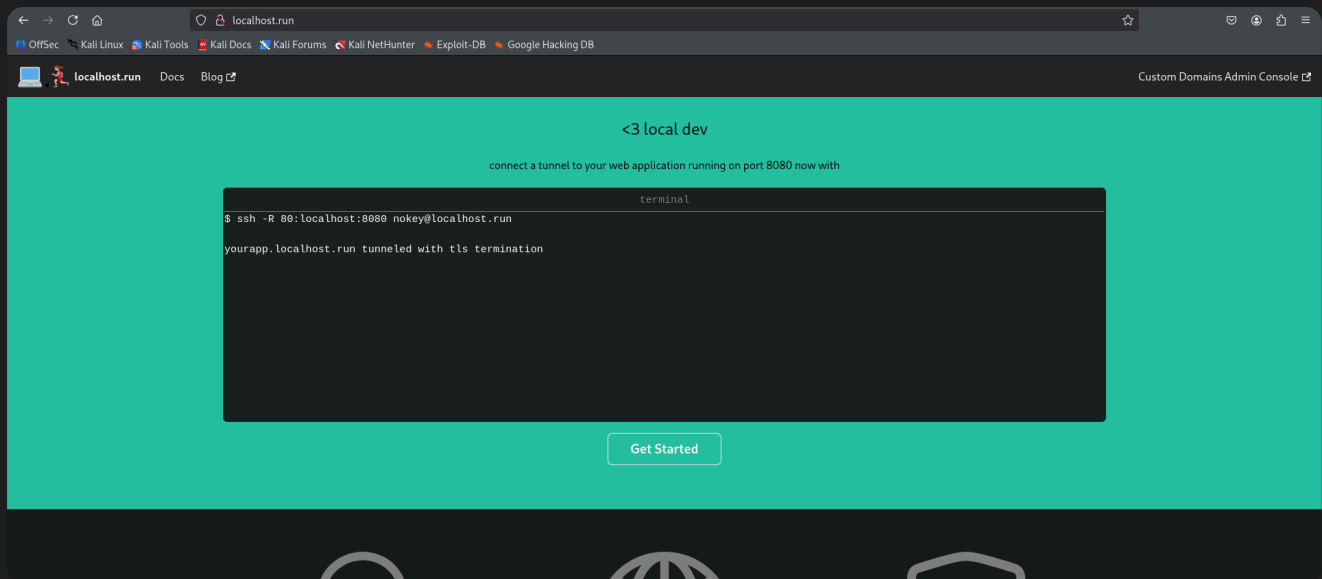

But we cant access the web server from a external system or in a public ip,to resolve the issue what can we do we just use port forwarding method.

To do that we can use some websites to forward our port and host our website for some time like--

<http://localhost.run/>

<https://portmap.io/>

step 1 :

Copy the command we got from this website and paste it into our host machine
`ssh -R 80:localhost:8080 nokey@localhost.run` here we change the command little bit, that was we change the localhost port from 8080 to 80 because the web server currently runs on port 80.

Step 2 :

final command is----

```
!!  ssh -R 80:localhost:80 nokey@localhost.run
```

This command:

```
!!  Creates a tunnel from your computer → to a remote server (localhost.run).  

    That remote server gives you a public URL so others can see your site.
```

So basically:

```
!!  You make your local website available on the internet instantly, using SSH.
```

Breaking Down the Command

ssh The **Secure Shell** program — used to connect securely to another computer.

-R Remote port forward

80 The **port on the remote server** (localhost.run)

localhost:80 The **destination on your local machine** (your local server running on port 80)

nokey@localhost.run This means:

Connect to the server **localhost.run**

As the user **nokey** (no password needed — it's a public tunnel service)

localhost.run is a free tunneling service — it creates a **temporary public address** (like **<https://abc123.localhost.run>**) that forwards to your local web server.

```

MINT: some lines were ellipsized, use -t to show in full.
[ranger@localhost ~]$ ssh -R 80:localhost:80 nokey@localhost.run
The authenticity of host 'localhost.run (34.82.85.249)' can't be established.
RSA key fingerprint is SHA256:FV8IMJ4IVjYUTnd6on7PqbRjaZf4c1EhhEBgeUdE94I.
RSA key fingerprint is MD5:fd:28:dc:f0:63:e9:4e:e2:7c:c0:6a:18:9f:b1:b0:f9.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added 'localhost.run,34.82.85.249' (RSA) to the list of known hosts.

Welcome to localhost.run!

Follow your favourite reverse tunnel at [https://twitter.com/localhost_run].

To set up and manage custom domains go to https://admin.localhost.run/

More details on custom domains (and how to enable subdomains of your custom
domain) at https://localhost.run/docs/custom-domains

If you get a permission denied error check the faq for how to connect with a key or
create a free tunnel without a key at [http://localhost:3000/docs/faq#generating-an-ssh-key].

To explore using localhost.run visit the documentation site:
https://localhost.run/docs/

** your connection id is f7d79cccd-2a00-45be-af4b-01a0a5e90ecc, please mention it if you send me a message about an issue. **

authenticated as anonymous user
30970d340df40a.lhr.life tunneled with tls termination, https://30970d340df40a.lhr.life
create an account and add your key for a longer lasting domain name. see https://localhost.run/docs/forever-free/ for more information.
Open your tunnel address on your mobile with this QR:
